

**The main objective is not simply to study technical or urban networks, as it is frequently practiced in Geography but to understand in the perspective of Management the links between their organization and space. Consequently the study scope is to define and to theorize how individual or local actors' networks (associational, familial, political, professional, confessional, entrepreneurial and so on) affect human relations in space, and how in reply, those relations may affect these networks.**

**The organized spaces are considered in link with the French language conception of "Territoires" or "Territory".**

**This subject originality comes from the translation in Geography and in the purpose of model building, of links between networks, organized spaces and innovation: i.e. a new trend, or definition, of a Territorial (or Spatial-based) innovation**

**The context of this study, as it is developed in the French language that is the support of the subject, refers to spatialized (or territorialized) models of innovation. The most important academic literature on this topic refers to theories of proximity, of positioned innovations, as on social effects of local development.**

**The project has to be realized in French language.**
